

Analytics: Enhanced Report Filter

With this release, we provide you with the functionally extended filter options in Analytics.

Using this optimized function, you can, for example, always display specific reports prefiltered.

The screenshot displays the 'Report Filters' section of an analytics dashboard. It features two filter groups: 'Device Class' with 'Tablet' and 'Smartphone' selected, and 'Entry Sources' with 'direct' selected. Below the filters are three buttons: 'Clear filters', 'Reset Filter', and 'Apply Filter'. The main content area is divided into three sections: 'Browser' with a bubble chart showing various browser versions (Safari 12 is the largest), 'Visits' with a line chart and a large '702' value, and 'Conversions' with another line chart. At the bottom, a table lists browser types and their corresponding visit counts.

Browser	Visits ↓
Safari 12	2178
Google Chrome 70	1197
Samsung Browser 7	837
Google Chrome 71	783
Safari 11	405
Safari	234

Example: Report filter in Analytics

The new report filters now include the following options:

- You can select several filter values per dimension (the OR operator then links the selected values).
- Filter values can be saved with the report configuration so that the report is filtered directly according to these values when called.

Example

By selecting the mobile device classes "Smartphone" and "Tablet," you can ensure that a report only contains data from mobile devices.

- You can lock the setting of each filter so that it cannot be changed in view mode.
- To facilitate input, suggestions are displayed as soon as you click on the input field.

The displayed proposals do not represent fixed values.
If there is no suitable proposal, you can enter the
required value.
